

## 14. Interval arithmetic

## Last time

- Connectivity: Networks / graphs
- Shortest path
- Models of real-world networks

# Goals for today

- Interval arithmetic
- Global optimization
- Finding roots

# Motivation: Ground state of atomic cluster

- $N$  atoms at positions  $\mathbf{x}_i \in \mathbb{R}^3$
- **Interaction potential**  $V(r_{ij})$  between pairs
- Ground state: Minimize **potential energy**

$$V(\mathbf{x}_1, \dots, \mathbf{x}_N) := \sum_{i=1}^N \sum_{j>i} V(r_{ij})$$

- $r_{ij} := \|\mathbf{x}_i - \mathbf{x}_j\|$  is distance between atoms  $i$  and  $j$

# Lennard-Jones potential

- Standard model of interaction between argon atoms:

$$V(r) := 4 \left( \frac{1}{r^{12}} - \frac{1}{r^6} \right)$$

- Problem: There are *lots* of local minima
- Estimated to grow like  $O(e^N)$
- To find the ground state we need **global optimization**

# Standard floats are not always good enough

- Rump's example: Calculate

$$f(a, b) = 333.75b^6 + a^2(11a^2b^2 - b^6 - 121b^4 - 2) + 5.5b^8 + a^7$$

at  $a = 77617$  and  $b = 33096$

- Something weird happens when trying `Float32`, `Float64` and `BigFloat` – totally different answers
- Which is correct?
- Kahan's example: Draw

$$f(x) = \frac{1}{50} \log |3(1 - x) + 1| + x^2 + 1$$

## What is 0.1 anyway?

- When I type `0.1`, what does it mean?
- Look at its value:

```
big(0.1)
```

- Look at its bits (binary representation):

```
bitstring(0.1)
```

## Calculating with sets

- Can we calculate with *sets* of real numbers instead
- E.g. “small” sets containing non-representable numbers like 0.1 or  $\pi$
- Or larger sets
- What are basic questions about function  $f$  on set  $X$ ?

## Range of a function

- Basic questions concern **range** of a function  $f$  on set  $X$
- $\text{range}(f; X) := \{f(x) : x \in X\}$
- Set of all possible output values for inputs in  $X$
- How can we calculate that?

## Range II

- Conceptually easy: Find minimum and maximum
- But we have seen that that itself is a hard problem!
- Can we obtain *some* information about range more easily?
- What would be most useful?
- What are simplest sets to think about?

# Intervals

- Range of real numbers
- Simplest: (closed) **interval** on real line:

$$X = [a..b] = \{a \leq x \leq b : x \in \mathbb{R}\}$$

- Write  $X = [a..b]$  to distinguish from array (standard notation  $[a, b]$ )
- Infinite (uncountable) number of elements  $x$  in set  $X$
- How represent  $X$  in Julia

# Intervals in Julia

## ■ Define new `SimpleInterval` type:

```
struct SimpleInterval  
    lo::Float64  
    hi::Float64  
end
```

```
Base.in(a::Real, X::SimpleInterval) = X.lo ≤ a ≤ X.hi
```

## ■ Package: `Interval` type in `IntervalArithmetic.jl`

## ■ Adds rounding

# Functions on intervals

- Suppose  $X$  is an interval
- Suppose  $f$  is a function like  $f(x) = x^2$
- Can we define  $f(X)$ ?
- What should this mean?
- How should we calculate it?
- Goal: Find range of  $f$  over  $X$

## Functions on intervals II

- Apply  $f$  to  $X$  by applying  $f$  to *each element of  $X$*
- Will give a new set as output
- Obviously *impossible* to do this since too many elements
- So instead use maths to calculate *what answer should be*

## Example: Squaring

- Let's think about  $f(x) = x^2$
- With  $X = [1..2]$
- What is result of squaring every element?
- So how can we define  $X^2$ ?
- What about  $[-1..2]^2$ ?

# Squaring II

■ General rule:

$$\begin{aligned} [a, b] &:= [a^2, b^2] && \text{if } a \geq 0 \\ &:= [0, \max(a^2, b^2)] && \text{if } a < 0 \text{ and } b > 0 \\ &:= [b^2, a^2] && \text{if } a < b < 0 \end{aligned}$$

## Example: Addition

- How should we define  $X + Y$  for intervals  $X$  and  $Y$ ?
- Want to add any  $x$  and  $y$  with  $x \in X$  and  $y \in Y$
- Problem: What is  $[0..1] - [0..1]$ ?

## Application: Finding roots

- Define  $f(x) = x^2 - 2$
- Calculate for  $X = [3..4]$
- Get  $f(X) = [7..14]$
- This does not contain 0
- Hence  $0 \notin \text{range}(f; X)$
- So *there is no root of  $f$  in  $X$*

# Review

- Defined arithmetic on intervals
- Applications to root finding and global optimization
